### ПОШИРЕННЯ ВІРУСУ МОЗАЇКИ ТУРНЕПСУ У СПРИЙНЯТЛИВИХ КУЛЬТУРНИХ РОСЛИНАХ СИЛЬНО ЗАЛЕЖИТЬ ВІД РІЗНИХ ПІДХОДІВ ДО ВИРОЩУВАННЯ

Зразки рослин з симптомами вірусу мозаїки турнепсу (TuMV) відбиралися з промислових полів вирощування хрестоцвітних культур у Київській обл. та на різних ділянках у місті Києві. TuMV був знайдений на всіх промислових полях, приватних присадибних ділянках та міських ділянках, а сумарний рівень інфекцій становив 50%. У даній роботі описуються наслідки застосування різних агрокологічних прийомів для поширення вірусу у сприйнятливих культурах та підтверджена важливість профілактичних заходів у боротьбі з вірусними хворобами.

Ключові слова: вірусу мозаїки турнепсу, вирощування хрестоцвітних культур.

### РАСПРОСТРАНЕНИЕ ВИРУСА МОЗАИКИ ТУРНЕПС У ВОСПРИИМЧИВЫХ КУЛЬТУРНЫХ РАСТЕНИЯХ СИЛЬНО ЗАВИСИТ ОТ РАЗНЫХ ПОДХОДОВ К ВЫРАЩИВАНИЮ

Образцы растений с симптомами вируса мозаики турнепса (TuMV) отбирались с промышленных полей выращивания крестоцветных культур в Киевской обл. и на различных участках в городе Киеве. TuMV был найден на всех промышленных полях, частных приусадебных участках и городских участках, а суммарный уровень инфекций составил 50%. В данной работе описываются последствия применения различных агроэкологических приемов для распространения вируса в восприимчивых культурах и подтверждено важность профилактических мероприятий в борьбе с вирусными болезнями.

Ключевые слова: вируса мозаики турнепса, выращивание крестоцветных культур.

### FLORISTIC CLASSIFICATION OF THE FLOODPLAIN ALDER, WILLOW AND POPLAR FORESTS IN THE BASIN OF THE LOWER SULA (UKRAINE)

The floodplain alder (*Alnus glutinosa*), willow (*Salix alba*, rarely *S. fragilis*) and poplar (*Populus nigra*, *P. alba*, outliers of *Populus x canescens*) forests in the basin of the lower Sula were investigated. Mesohygrophilous forests of European black alder were referred to *Alno-Ulmion alliance Querco-Fagetea class* (com. *Aegopodium podagraria-Alnus glutinosa*, *D. c. Acer negundo-Alnus glutinosa*). Swamp forests of European black alder of *Alnetea class* are mostly common in the floodplains of small rivers and are represented by two associations (*Carici ripariae-Alnetum glutinosae* and *Carici acutiformis-Alnetum glutinosae*). The floodplain willow and poplar forests were referred to class *Populetea albae* (order *Populetea albae*). Willow forests of floodplains of the river Sula and its tributaries and also waterlogged gully talwegs and rarely outliers belong to *Salicion albae alliance* and *Salicetum albae association*. Lower reach poplar forests of the river Sula floodplain belong to *Calamagrostio epigei-Populion nigrae alliance* and are divided into two associations that we propose to change in accordance with the requirements of the International Code of Phytosociological Nomenclature for *Galio veri-Populetea nigrae* and *Strophostomo sparsiflorae-Populetea albae*. It is emphasized that the studied groups don't contain the species from the Red Data Book of Ukraine. The alder, willow and poplar forests of each association that are least transformed, largest in area and oldest require the nature reserve creation, that is proved by their significant water conservation role.

Key words: *Querco-Fagetea (Alno-Ulmion)*, *Alnetea*, *Populetea albae*, Ukraine, Dnieper left-bank Forest-Steppe, basin of the lower Sula, syntaxonomy.

**Introduction.** The floodplain alder (*Alnus glutinosa* (L.) P. Gaertn.), willow (*Salix alba* L., rarely *S. fragilis* L.) and poplar (*Populus nigra* L., *P. alba* L., *Populus x canescens* (Ait.) Smith. forests are located throughout the whole re-

gion of our research of the floodplain of Sula river and its branches, however on the left bench they are less numerous. Accumulation and generalization the data about its phytocoenotic diversity according to the methodology of

G.Brown-Blanche school have been conducted for the last decades [1, 4-5, 6, 9, 12-14]. The results were included and critically processed in the monograph dedicated to the classification of the Northern Black Sea area forests [10].

Concerning the basin of Sula river, floristic and syntaxonomic content of flooded forest is not studied enough. We continued and detailed the study of flooded forests according to the methodology of G.Brown-Blanche school. These researches are important considering the fact that such forests have significant water preservation value and make up important resource of its ecological network. Also, the most part of the forests has been cut down or transformed. Integrating new phytocoenotic material into scientific use will help to solve the problems of ecology – floristic classification of willow, poplar and alder forests of the Forest-Steppe region of Ukraine.

**Physical and geographical features of the researched object.** The lower Sula basin is situated in Pridniproviskiy lowlands between Poltava and Cherkasy administrative regions. It spreads from the confluence of Udai river (northern part of Lubny city) into the mouth of Sula. Now it is flooded by the waters of Kremenchug reservoir. The main branches of this part of the river are Sliporid and Orgytsa and both of them flow into Sula from the right side. Basin of the Sula river is situated within Obolon-Gradyz physical-geography region.

The main feature of lower Sula basin climate is gradual decrease of the amount of precipitations in eastern and southern directions, which is about 500 mm per year. Average year temperature estimated about +6°C. The relief is represented by reduced plain with integrated left tributaries of the Dnieper throughout the area. Flooded poplar, willow and alder forests are located throughout the whole region of our investigation of the floodplain of Sula river and its branches, however on the left bench they are less numerous. They are characterized by mostly short term flood regime, however during the last decade, the flood has become a rare phenomenon for this area. Their hydrological regime significantly impacted drainage reclamation, which covered most of the floodplains of small rivers and flood waters Kremenchug reservoir, resulting in decreased fluctuation amplitude of the water level and alluvium deposits.

**Materials and methods.** 74 geobotanical descriptions were used in this work, 53 of them were made by O.Yu. Smagliuk in the valley of lower Sula and its branches in 2014-2015 and 21 descriptions of N.O.Smoliar during shared expedition in 2015.

The descriptions were performed and processed according to the methodology of G.Brown-Blanche school [8]. The size of descriptive area was about 25x25m, sometimes the area was within natural phytocenotic boundaries if the area was small or striped. During the processing, part of descriptions were discarded as transitions between different sub-associations. Abundance points given in the table correspond to the following indexes of projective cover: + – < 1%, 1 – 1-5%, 2 – 6-15%, 3 – 16-25%, 4 – 26-50%, 5 – 51-100%. Points of permanence denote: + – < 10%, I – 10-20%, II – 21-40%, III – 41-60%, IV – 61-80%, V – 81-100%. Layering is shown in parentheses after the name of species of trees and bushes: a – the top wood tier; b – shrub tier; c – grass tier. The names of the species are given according to S.L.Mosyakin and M.M. Fedoronchuk [15].

## Results and discussions

### Syntaxon layout of flooded willow, poplar and alder forests of the lower Sula basin

### Characteristic of marked syntaxons

All descriptions of willow forests in the lower Sula basin are summarized in one table (Table 1). They are divided into two classes – **Quercu-Fagetea** and **Alnetea glutinosae**. The first one includes mostly drained alder populations of nemoral type. Because of its defect, the associations were not identified and only two groups were separated. Swampy black-alder forests classified as **Alnetea glutinosae**, which includes two associations. Overall, associations of alder forests are richer than willow forests in terms of floristic content but less rich than poplar forests.

**Legend for descriptions**

Description 1. N.O. Smoliar 25.05.2015. Flooded forest between villages Bilousivka and Kozorizi (Cherkasy region Drabivsky district).

Description 2. O.Yu.Smagliuk 30.04.2015. Mixed deciduous forest in the "Morozivska dacha" in the outskirts of Lubny city in the valley of meandering stream. Diameter of alder 0.3 m, poplar – 0,5 m, willow – 0,6 m, height of 27 m.

Description 3. O.Yu.Smagliuk 25.05.2015. Alder on the floodplain of Chumgak between villages Bilousivka and Kozorizi. Alder diameter 0,6-0,7 m, height of 28 m.

Description 4-5. O.Yu.Smagliuk 23.05.2014. Transformed alder swamp in the lowland of floodplain of Orzhytsa river (Poltava region, village Zolotuhi, Orzhytsia district).

Description 6. O.Yu.Smagliuk 03.05.2014. In the terrace reduction of Sula river valley (Poltava region, Velykoburimske forestry).

Description 7. O.Yu.Smagliuk 08.05.2014. On the floodplain. Orzhitsa at the indigenous banks (Poltava region, Orzhyske forestry).

Description 8. O.Yu.Smagliuk 24.05.2014. On the floodplain of Sula (Poltava region, between the villages, Velykoselytske and Maloselytske, Orzhysia district).

Description 9-12. O.Yu.Smagliuk 25.05.2015. In alder floodplain of Chumgak river near Bilousivka village. Alder diameter 0,35-0,4 m, height 20 m.

Description 13. O.Yu.Smagliuk 25.05.2015. In the alder forest on the floodplain of Gnyla river near village Rudka) (Poltava region, Hrebinka district). The diameter of alder 0,3 m, height is 23 m.

Description 14. O.Yu.Smagliuk 23.05.2014. In lowland with wet soil on the floodplain of Sliporid river (Poltava region, near the villages Novoselivka-Pryymivschyna-Voronynsi).

Description 15. O.Yu.Smagliuk 08.05.2014. On floodplain of Orzhutsia river, far from the root bench (Poltava region, Orzhyske forestry)

Description 16. O.Yu.Smagliuk 03.05.2014. On the floodplain of Sula river near the root bench (Poltava region, Velykoburimske forestry).

Description 17. O.Yu.Smagliuk 08.05.2014. In the deforestation zone of the floodplain of Orzhysia river (Poltava region, Orzhyske forestry).

Aggregation **Alno-Ulmion** includes hygrophillic deciduous forests. On the research territory it is introduced by frequently transformed communities as a result alder drainage. As a result of peat decomposition and nutrients enrichment we can observe the increase of nemorial mesophytes and nitrophillic species, and also increasing of alder populations. Diagnostic list represents its differentiation from swampy alder forests.

Aggregation **Aegopodium podagraria-Alnus glutinosa** (Alno-Ulmion) represented by old natural forests with tree diameter 0,6-0,7 m 27-28 m heigh. Widely spread on the floodplains of the streams and small rivers among the mas-

#### Legends for descriptions

Description 1. O.Yu. Smagliuk 03.05.2014. In reduced beams on the floodplain of Sula river, near Lyaschivka (Chornobaiivsky area Cherkasky district 29 block about 30 quarter).

Description 2. O.Yu. Smagliuk 25.05.2015. In poplar forest of river Chumgak valley, near Bilousivka (I Prokhorov-in Zolotoniyskiy forestry). At the foot of the slope of the indigenous banks plain area. The diameter 0,3-0,8 m, height 22 m.

Description 3. O.Yu. Smagliuk 29.04.2015. In osier bed in thalweg beams Lubenskiy Forestry AIC (tract Vynnytsia 23 quarter). The diameter 0.4 m, height 30 m.

Description 4. O.Yu. Smagliuk 03.05.2014. In the floodplain of Sula river near Mokhnach (Chernobaevsky area Cherkasy region).

Description 5. O.Yu. Smagliuk 23.05.2014. In the plantation of poplar and willow in broadleaf forests around Aleksandrovka (Lubny Poltava region, 35 quarter 2 division).

Description 6. N.O. Smoliar 25.05.2015. In willow riparian forests near river Chumgak around Bilousivka. In description present green moss – 2% of coverage.

Descriptions 7, 10. N.O. Smoliar 30.04.2015. In willow forests of botanical nature monument "Mgarska dacha" (outskirts of Lubni).

Description 8. O.Yu. Smagliuk 26.05.2015. In a young osier bed floodplain of Chumgak river between villages Bilousivka and Kozorizi. The diameter 0,1-0,35 m, height – 16 m.

Description 9-10. O.Yu. Smagliuk 30.04.2015. In a large array willow forests of "Mgarska dacha". Water is squeezed. The diameter of 0.4 m, height – 26 m.

Description 11. N.O. Smoliar 26.07.2015. Trench among the fields to the right from the highway from Lypove to Kryva Ruda (Poltava region, Semyonov district).

Description 12. N.O. Smoliar 27.07.2015. Trench near the village. Demianivka (Poltava region, Semyonov district).

Descriptions 13, 14. O.Yu. Smagliuk 27.07.2015. On the island Vysokyi of Sula river. Implanted willows, diameter 0,2-0,4m, height 25 m.

Descriptions 15. O.Yu. Smagliuk 27.07.2015. On the island Horbivka of Sula river. Diameter 0,2-0,3 m, height 13 m.

Descriptions 16. N.O. Smoliar 26.07.2015. Trench on the north-east from village Demyanivka poplar diameter 0,2-0,3m, height – 18 m.

Description 17. O.Yu. Smagliuk 26.07.2015. Trench on the north-east of Tukalo village (Poltava region, Semyonov district). 0.5 m elm diameter, willow – up to 1 m, height – 12 m.

Description 18. O.Yu. Smagliuk 26.07.2015. In the floodplain of Sula near the ferry of Tarasivka village (Poltava region, Orzhysia district). Willow diameter 0.3 meters, height – 24 m.

The union **Salicion albae** includes more humid aggregations of the class which are represented by white willow forests of the floodplain of Sula and its right branches, wetland thalweg ravines on its left bank and, occasionally, branches of the left bank. They are clearly divided into three groups – mesophyllic, meso-hygrophyllic and hygrophyllic. They do not have much in common in terms of species content. We have marked them within the rank of provisor sub-associations of the **Salicetum albae** association. After some time, as the phytocenotic material of related areas will be accumulated, their syntaxonic status must be updated. It is also typical that these three sub-associations show complete similarity of species and ecotype conditions towards listed above syntaxons of alder forests – union **Aino-Ulmion** and associations of **Carici ripariae-Alnetum** and **Carici acutiformis-Alnetum**. Average density of wood tier estimates 0,65, shrub – 0,2, grass tier coverage – 75%. Willow forests in terms of floristic diversity are inferior to alder and poplar forests.

Sub-association of **S.a. aegopodietosum podagrariae** represents natural and cultivated white willow forestries mainly in moist thalwegs, sometimes on the higher creek's areas of Sula and Sula's tributaries that have a lot of mineral and organic compounds. Diameter of willow is in range of 0,1-0,8 m and height is 22-30 m. Scrubbery and herbaceous layers mostly consist of nemoralis (forest) species. Some of the sub-association's territories are used as pastures. Medium tree crown density is 0,7, medium density of scrubbery layer is 0,3, grass layer – 80%.

Sub-association of **S.a. urticetosum galeopsifoliae** represents meso hygrophyllic natural white willow forests in moist thalweg, in particular on the territory of botanical nature monument "Mgarska dacha" (outskirts of Lubny), the lower parts of the floodplain Sula and its tributaries (mostly river Chumgak), on rich mineral and organic nutrients, somewhat nitrified soils. In summer water lies on the depth of 0,2-0,3 m or almost near the ground surface; in spring and after rains flowing water is above the ground level. Diameter of willow ranges from 0,1-0,7 m, height – 16-27 m. Scrubbery and herbaceous layers include typical species of swampy alder forests, excluding typical species of **Salicion albae union**. In the aggregations of sub-associations of "Mgarska dacha" was found a very rare species for Forest-Steppe – *Urtica kioviensis*. Average density of wood tier estimates 0,7, scrubbery – 0,2, grass tier coverage – 80%. Floristic index is high for the willow forests of the region.

Sub-association of **S.a. caricetosum acutiformis** represents hygrophyllic, periodically flooded but mostly drained natural and planted white willow forests on the floodplains of lower Sula area islands and in the fields on the left bank, and also in the lower basin of Sula. Diameter of willow ranges from 0,2-0,4 m, height – 13-25 m. Among shrub and grass tiers, typical species of **Salicion albae union** are dominant. Average density of wood tier estimates 0,5, shrub – 0,15, grass tier coverage – 70%, it means that density of all levels

#### Legends for descriptions

Description 1. N.O. Smoliar 27.07.2015. In the tract "Horbivka" on Romanov Horb Island in the gulf of Sula.

Description 2. N.O. Smoliar 27.07.2015. In the tract "Dubina" on the island Lyaschivka in Sula lough. Implanted poplars in the peripheral zone of the island.

Description 3. O.Yu.Smagliuk 24.07.2014. Areas of floodplain of Sula river near the bridge across Sula.

Description 4-6. O.Yu.Smagliuk 23.05.2014. Poplar plantations on the southern part of village. Nesen-Irzhavets (Poltava region, Orzhysia district).

Description 7-10. O.Yu. Smagliuk 26.07.2015. Forest area of the floodplain near Sula upland terraces near Lypove village. The diameter of poplar 0,3-0,4 m, height – 23 m.

Description 11. N.O. Smoliar 27.07.2015. Trench in the center of the field, right to the highway from Kryva Ruda to Lypove.

Description 12. N.O. Smoliar 27.07.2015. On the island Vysokiy in the gulf of Sula.

Description 13. N.O. Smoliar 26.07.2015. Trench system on the fields near Demyanivka village.

Description 14. N.O. Smoliar 26.07.2015. Trench in the center of the field near Kryva Ruda village (Poltava region, Semyonov district).

Description 15. N.O. Smoliar 30.04.2015. On the territory of "Mgarska dacha" near the city Lubny.

Description 16. O.Yu.Smagliuk 26.07.2015. Trench in the outskirts of Kukoba village (Poltava region, Semyonov district).

Description 17. N.O. Smoliar 26.07.2015. Trench system in the center of the field in the outskirts of Demyanivka village.

Association **Galio veri-Populetum nigrae** nom. nov. prov.

**Diagnostic species:** *Populus nigra* (dom.), *Salix alba* (dom.), *Calamagrostis epigeios*, *Carex praecox*, *Galium verum*.

The majority of poplar forests of the lower Sula basin are close to association, described as a variant of **Populus nigra** (nomenclature type of this association belongs to this variant) association **Galio veri-Aristolochietum clematidis** Shevchyk et V.Sl. 1996 [14]. But this name contradicts to the International Code of Phytosociological Nomenclature [17], because it does not contain any type of dominant tier (trees) in its name, so it must be changed. So, we propose the new name – **Galio veri-Populetum nigrae**.

Aggregations of association in the territory of experimental region are natural aggregations of black poplar, black poplar's croppers aging up to 50 years and spontaneous forests in the former agricultural lands. They are detected on the Sula's flood plains, frequently on the islands of Sula's creeks, sometimes in the form of small forestries among the fields on Sula's left shore. These are the driest aggregations on the experimental territory. Even though humidity varies according to season, floods in the experimental region are rare. Diameter of black poplar is in range of 0,1-0,5 m and height is 6-28 m. Medium density of tree crowns is lowest among poplars' aggregations (0,55) and scrubbery (0,1), covering of grass layer is considerable – 0,55. These aggregations are the poorest in floristical contingent among poplars' aggregations.

Association **Strophostomo sparsiflorae-Populetum albae** nom. nov. prov.

**Diagnostic species:** *Populus alba* (dom.), *P. nigra* (dom.), *Amorpha fruticosa*, *Humulus lupulus*.

Most of white poplar forests of the lower Sula basin are close to association, described as **Strophostomo sparsiflorae-Amorphetum** Shevchyk et V.Sl. 1996 [14]. But this name contradicts to the International Code of Phytosociological Nomenclature [17], because it does not contain any type of dominant tier (trees) in its name, so it must be changed. What we offer here is previously called **Strophostomo sparsiflorae-Populetum albae**. Association represents flooded and trench poplar forests of the valley of Sula river. Diameter of poplars ranges between 0,3-0,5 m, height – 23-27 m. Average density of wood tier estimates 0,8, shrub – 0,4, grass tier coverage – 35%.

Aggregations of **Swida sanguinea-Populus x canescens (Calamagrostio epigei-Populion nigrae)** diagnosed in trenches throughout the fields. They have been formed by hybrid species (*Populus alba* x *P. tremula*) and noticed in the outskirts of villages Kryva Ruda, Demyanivka, Kukoba, Semenov district of Poltava region. Also, indicated on the territory of botanical natural monument "Mgarska dacha" near Lubny and on the Vysoky island in Sula lough. Diameter of the poplar ranges from 0,07-0,4 m, height – 15-18 m. Syntaxonomical position of the aggregation requires more researches, probably it should be referred to recently described class **Dactylido glomeratae-Populetea tremulae** Vorobyov et I. Solomakha in I.Solomakha et al. 2015 [10]. Average density of wood tier is 0,8, shrub – 0,35, grass tier coverage – 45%. In terms of floristic content these communities are the richest among poplar forests.

Aggregations of **Carex hirta-Populus balsaminus (Calamagrostio epigei-Populion nigrae)** was found in one of the trenches in the fields, left from the highway from Lypove to Gradyzk near Demyanivka village, Semenov district of Poltava region. Density of wood tier is low – 0,4, shrub and seedings – 0,6, grass tier coverage – 60%.

**Conclusion.** Flooded alder (*Alnus glutinosa*), willow (*Salix alba*, зрідка *S. fragilis*) and poplar (*Populus nigra*, *P. alba*, *Populus x canescens*) forests in the basin of lower Sula occupy a lot of space and characterized by significant level of cenotic diversity. In particular, meso-hygrophyllic black alder forests have been assigned to the **Alno-Ulmion** union of the **Quercu-Fagetea** class, which is divided into two groups. Swampy black poplar forests, which are distributed mainly on the floodplains of small rivers, have been assigned to **Alnetea glutinosae** class, within which two associations were identified. One of them – is the most common among alder forests of the region association **Carici ripariae-Alnetum glutinosae** – three variants were selected. Flooded forests with the domination of **Salicaceae** family species have been assigned to **Populetea albae** and order **Populetaia albae**. Willow forests of the floodplains of river Sula and its branches, and also moist thalweg ravines and, occasionally, trenches, belong to the union **Salicion albae** and association **Salicetum albae**. Within the association, three widespread but very different sub-associations have been previously allocated (its rank must be obviously increased), homologous to syntaxons of alder forests and one community of unidentified status. Poplar forests of Sula lower course floodplains including those which are situated on the islands of the Sula lough, occupy less area comparing to alder and willow forests, most part of them was implanted. They belong to the union **Calamagrostio epigei-Populion nigrae**, and, according to the dominant tree layer is divided into two associations, which name we offer to change according to the International Code of Phytosociological Nomenclature [17] – **Galio veri-Populetum nigrae** and **Strophostomo sparsiflorae-Populetum albae** (two options selected). Trench aggregations of the left bench of Sula lower course **Swida sanguinea-Populus x canescens** turned out to be

very interesting, but, for now, they are described as non-ranked. Its syntaxonomical status must be specified. Community of *Carex hirta*-*Populus balsaminus* was found only in one locality. It should be noted that species from the Red Book were not found in alder, willow and poplar forests of the lower basin of Sula river, however a number of regionally rare species were revealed and a separate publication will be dedicated to this theme.

Considering the risks of damages and adventisation of the flora, the least transformed, the largest and the oldest poplar, alder and willow forests of each association require preservation. Significant water preservation role is the indisputable argument for prohibition of its total deforestation.

### ФЛОРИСТИЧНА КЛАСИФІКАЦІЯ ЗАПЛАВНИХ ВІЛЬХОВИХ, ВЕРБОВИХ І ТОПОЛЕВИХ ЛІСІВ У БАСЕЙНІ НИЖНЬОЇ СУЛИ (УКРАЇНА)

Досліджено заплавні вільхові (*Alnus glutinosa*), вербові (*Salix alba*, зрідка *S. fragilis*) та тополеві (*Populus nigra*, *P. alba*, колки з *Populus x saepesens*) ліси у басейні нижньої Сули. Мезогірофільні чорновільхові ліси віднесені до союзу *Alno-Ulmion* класу *Quercus-Fagetea* (сст. *Aegorodion podagrariae-Alnus glutinosa*, Д.с. *Acer negundo-Alnus glutinosa*). Заболочені чорновільхові ліси класу *Alnetea* поширені переважно на заплавах малих річок і представлені двома асоціаціями (*Carici ripariae-Alnetum glutinosae* та *Carici acutiformis-Alnetum glutinosae*). Заплавні вербові та тополеві ліси віднесені до класу *Populetea albae* (порядок *Populetalia albae*). Вербові ліси заплави Сули та її притоки, а також перезволожений тальвегіє балок та зрідка колкіє належать до союзу *Salicion albae* і асоціації *Salicetum albae*. Тополеві ліси пониження заплави Сули належать до союзу *Salicagrostio epigei-Populion nigrae* і розділяються на дві асоціації, назву яких пропонуємо змінити згідно з вимогами Міжнародного кодексу фітосоціологічної номенклатури – *Galio veri-Populetum nigrae* та *Strophiosotum sparsiflorae-Populetum albae*. Наголошується на відсутності в досліджених угрупованнях видів із Червоної книги України. Найменш трансформовані, найбільші за площею та найстаріші вільхові, вербові та тополеві ліси кожної з асоціацій потребують заповідання, на користь чого свідчать також їх значна водоохоронна роль.

Ключові слова: *Quercus-Fagetea (Alno-Ulmion)*, *Alnetea*, *Populetea albae*, Україна, Лівобережний Лісостеп, басейн нижньої Сули, синтаксонія.

### ФЛОРИСТИЧЕСКАЯ КЛАССИФИКАЦИЯ ПОЙМЕННЫХ ОЛЬХОВЫХ, ИВОВЫХ И ТОПОЛЕВЫХ ЛЕСОВ В БАСЕЙНЕ НИЖНЕЙ СУЛЫ (УКРАИНА)

Исследованы пойменные ольховые (*Alnus glutinosa*), ивовые (*Salix alba*, зрідка *S. fragilis*) и тополевые (*Populus nigra*, *P. alba*, колки с *Populus x saepesens*) леса в бассейне нижней Сулы. Мезогирофильные ольховые леса отнесены к союзу *Alno-Ulmion* классу *Quercus-Fagetea* (сст. *Aegorodion podagrariae-Alnus glutinosa*, Д.с. *Acer negundo-Alnus glutinosa*). Заболоченные ольховые леса класса *Alnetea glutinosae* распространены преимущественно в поймах малых рек и представлены двумя ассоциациями (*Carici ripariae-Alnetum glutinosae* и *Carici acutiformis-Alnetum glutinosae*). Пойменные ивовые и тополевые леса отнесены к классу *Populetea albae* (порядок *Populetalia albae*). Ивовые леса поймы Сулы и ее притоков, а также переувлажненных тальвегов балок и изредка колков принадлежат к союзу *Salicion albae*

Received to editorial board 03.10.16

и ассоциации *Salicetum albae*. Тополевые леса низовой поймы Сулы отнесены к союзу *Calamagrostio epigei-Populion nigrae* и распределяются на две ассоциации, название которых предлагаем изменить согласно требований Международного кодекса фитосоциологической номенклатуры – на *Galio veri-Populetum nigrae* и *Strophostomo sparsiflorae-Populetum albae*. Указывается на отсутствие в исследуемых сообществах видов растений из Красной книги Украины. Наименее трансформированные, наибольшие по площади и более старые ольховые, ивовые и тополевые леса каждой из ассоциаций требуют заповедания, в пользу чего свидетельствует их значительная водоохранная роль.

Ключевые слова: *Quercus-Fageteta (Alno-Ulmion)*, *Alnetea glutinosae*, *Populetea albae*, Украина, Левобережная Лесостепь, бассейн нижней Сулы, синтаксономия.

## MOLECULAR AND GENETIC CHARACTERISTICS OF SURFACE AND NONSTRUCTURE PROTEINS OF PANDEMIC INFLUENZA VIRUSES A(H1N1)PDM09 IN 2015-2016 EPIDEMIC SEASON

The aim of the present study was identifying of molecular and genetic changes in hemagglutinin (HA), neuraminidase (NA) and non-structure protein (NS1) genes of pandemic influenza A(H1N1)pdm09 strains, that circulated in Ukraine during 2015-2016 epidemic season. Samples (nasopharyngeal swabs from patients) were analyzed using real-time polymerase chain reaction (RT-PCR). Phylogenetic trees were constructed using MEGA 7 software. 3D structures were constructed in Chimera 1.11.2rc software. Viruses were collected in 2015-2016 season fell into genetic group 6B and in two emerging subgroups, 6B.1 and 6B.2 by gene of HA and NA. Subgroups 6B.1 and 6B.2 are defined by the following amino acid substitutions. In the NS1 protein were identified new amino acid substitutions D2E, N48S, and E125D in 2015-2016 epidemic season. Specific changes were observed in HA protein antigenic sites, but viruses saved similarity to vaccine strain. NS1 protein acquired substitution associated with increased virulence of the influenza virus.

Key words: A(H1N1)pdm09 influenza virus, amino acid substitution, antigenic site, non-structure protein.

**Introduction.** Influenza viruses are antigenically variable pathogens, capable of continuously evading immune response. Accumulation of mutations in the antigenic sites is called the "antigenic drift". In circulating influenza viruses this antigenic drift is a major process, accumulating mutations at the antibody binding sites of receptor proteins, and enabling the virus to evade recognition by hosts' antibodies, which often translates into periodic epidemics of influenza. To tame the influenza spread a flexible vaccination WHO's program, based on periodic production of novel versions of vaccine, is adapted to the actually prevalent strain(s). For such programs the data on phylogenesis of circulating versions of pathogens, and genetic stability of their hemagglutinin (HA) sets data, could help to rationalize possible epidemiological measures [1].

This year's seasonal influenza risk assessment identifies type A viruses, in particular A(H1N1)pdm09, as dominant thus far in EU/EEA countries. There are strong indications from some EU/EEA countries that the A(H1N1)pdm09 virus is responsible for the hospitalization of a large number of severe cases. This includes hospitalizations for severe outcomes for both risk groups and otherwise healthy young adults. A similar pattern of severity is likely to be observed in other countries as the season progresses [2].

**Materials and methods.** Samples were analyzed using real-time polymerase chain reaction (RT-PCR). Influenza viruses subtype A(H1N1)pdm09 were isolated in MDCK and MDCK-SIAT cell culture from samples positive in PCR. Hemagglutinin (HA), neuraminidase (NA) and non-structure protein (NS1) gene sequences of Ukrainian isolates were selected to perform phylogenetic comparisons. Phylogenetic analysis was performed using MEGA 7 software [3]. The influenza A(H1N1)pdm09 sequences are characterized in a neighbor-joining phylogenetic tree with reference strains rooted from the current vaccine strain, A/California/07/2009-like virus. 3D structures were constructed in Chimera 1.11.2rc software [4].

**Results and discussion.** In this study we compared nucleotide sequences of influenza viruses HA, NA and NS1 proteins.

*Comparison of neuraminidase (HA) genes.*

Over the last five years the HA genes have evolved and eight genetic groups have been designated, with A/California/7/2009 representing group 1, and viruses in group 6 have formed clusters designated groups 6A, 6B and 6C. Viruses collected in 2015-2016 season fell into genetic group 6B and in two emerging subgroups, 6B.1 and 6B.2. Subgroup 6B and subgroups 6B.1 and 6B.2 are defined by the following amino acid substitutions in HA1 and HA2.

Most of the viruses had amino acid substitutions that define the new group of viruses in genetic group 6B, now called group 6B.1. Isolates had a substitution at one of these sites N162K resulting in loss of glycosylation site, acquired by the 6B.1 viruses (fig.1).

Also Ukrainian viruses had substitutions S84N and I216T. Three isolates from Khmelnytsky, Kiev and Ternopol had unique mutation in HA2 – I91V. New substitution S83P was observed in the majority of viruses from 6B.1 group. Four isolates from Odessa belonged to group 6B.2. Its HA protein had a substitution at residue 152 of HA1, V152T. Substitutions in this region, as well as at residue 152, are often selected in culture and known to affect the antigenicity of the virus. Viruses from group 6B.2 also had substitutions R113K D127E (gain of glycosylation site) and E47Q (HA2).

Gain or loss of N-linked glycosylation sites has been shown to alter HA protein surface topology. A gain in glycosylation could be advantageous to the virus by virtue of a masking effect on important antibody recognition sites, thus potentially modulating viral antigenicity [5]. Observations are based solely on sequence motifs. For the influenza A(H1N1)pdm09 specimens characterized in this report, two mutations, S162N (serine to asparagine) and D127E (asparagine acid to glycine acid), were observed that could cause a gain of a glycosylation motif.
