BENCHMARKING OF BANK PERFORMANCE USING THE LIFE CYCLE CONCEPT AND THE DEA APPROACH

Abstract

Despite the widespread use of benchmarking as an effective tool for improving the efficiency of the bank's functioning, its implementation does not take into account the relation between comparable performance indicators, the choice of benchmark for comparison, deviations of indicators from target values with stages of the bank's life cycle, which cause differences in the intensity and characteristics of development of financial institutions. The procedure for identifying a reference bank for comparison is also insufficiently specified, which is important in terms of adapting its experience by the recipient bank due to the possible fundamental differences in their functioning. Therefore, the article has modified the technology of benchmarking of the bank's performance based on the life cycle concept and the DEA approach.

The research is based on the use of the DEA method to determine the most efficient bank as a reference bank in benchmarking comparison; canonical analysis – for the formation of a list of indicators of bank performance; cluster analysis – to substantiate the levels of deviations of the actual values of comparable indicators from the target ones.

The study envisages, firstly, the selection of indicators for benchmarking comparisons based on the identification of causal relationships between the indicators of subsystems "Finance", "Customers", "Business processes", "Personnel development" that arise at each stage of a bank's life cycle; secondly, the choice of a benchmark bank for comparison according to the maximum value of the performance indicator calculated through the DEA method for a set of banks that are at one and the same stage of their life cycle; thirdly, definition of the range of deviations (low, permissible, critical) of the actual values of comparable indicators of the effectiveness of management of finance, customer base, business processes and personnel of the bank from the target ones. A practical testing of the benchmarking technology was carried out on the example of Ukrainian banks, whose stage in 2016 was identified as "intense growth".

Keywords	bank, benchmarking, bank performance indicators, BSC, bank life cycle stage, DEA

JEL Classification	G21, C14, O12

INTRODUCTION

It is important to ensure an effective operation of banks through continuous monitoring over the effectiveness of management of finances, customer base, business processes and personnel compared to those banks that are the leaders on the relevant market segment and through the implementation of those advanced methods and tools that have already proved to be effective.

A more active use of benchmarking by Ukrainian banks is also caused by the need to strengthen their adaptability and to ensure efficiency in response to negative trends in the banking sector: since 2008, its func-

tioning is characterized by a decrease in efficiency (according to the results of 2016, the loss amounted to 159388 million UAH, the indicator of profitability of the assets and capital reached the lowest values in the last ten years: -12.6% and -116.74%, respectively), deterioration in the quality of assets (in 2016, the volume of overdue debt amounted to 24.2%), significant reduction in the number of operating banks (from 175 in the beginning of 2008 to 96 in the beginning of 2017) (National Bank of Ukraine, 2016).

The relevance of using benchmarking is confirmed by the surveys of more than 13000 respondents (company management) from more than 70 countries carried out by the consulting company Bain & Company regarding the priority of using management tools (Rigby & Bilodeau, 2015). According to the survey, benchmarking is in the top-10 management practices from 2000 to 2015, while in 2008, 2010 and 2011, it ranked first (in North America, it is now on the first position). In 2014, benchmarking was particularly popular among big companies. It was used by 44% of the surveyed companies compared to 40% in 2012 (in 2015, it was expected to reach 77%). The level of management satisfaction with this technology is 3,8 points on a five-point scale. Experts of the Bain & Company believe that benchmarking helps identify ways to improve performance, to focus on strategic opportunities, accelerate organizational learning through new ideas (Rigby & Bilodeau, 2015).

The advantages of the use of benchmarking by Ukrainian banks include opportunities to compare the strengths and weaknesses of their activities with more successful banks, to realize the realistic achievable level of efficiency, to adjust the parameters of the bank's functioning in accordance with market requirements, to increase its competitiveness. In addition, benchmarking aims at identifying strategic reference points of banks for strengthening their positions, facilitating the transfer of new ideas and technologies.

Despite the fact that the world practice has a successful experience of using benchmarking, most Ukrainian banks do not fully utilize this technology and apply it without interrelation with the stages of life cycle that causes differences in strategic guidelines, developmental intensity, financial needs and goals of banks. The use of benchmarking without taking into account the stage of development of the bank may lead to inconsistency of the real results from its implementation and the expectations of the bank's management and other stakeholders, to low efficiency of financial decisions.

An important stage in benchmarking is the choice of reference points for comparison. This task is usually solved by compiling bank ratings. However, most rating methodologies generalize financial coefficients that can be multidirectional and not provide an opportunity to objectively measure the performance, while effectively functioning objects should be selected in benchmarking comparisons. Therefore, it is advisable to determine a reference bank based on the DEA method, in which, unlike other methods, efficiency is a key concept and is determined by comparing the related input and output parameters.

The purpose of the article is to develop a technology of banking benchmarking using the concept of life cycle and the DEA approach.

1. LITERATURE REVIEW

1.1. The essence and stages of benchmarking

Benchmarking is a business concept used in the field of strategic planning, marketing, restructuring, financial management and the practice of "learning from the best". There is a significant number of interpretations of benchmarking. A classical one is the definition of the founder of this management improvement method, head of the Global Benchmarking Network, Robert Kemp, who understands benchmarking as "a search for and implementation of the best practices that improve performance" (Camp, 1989). According to Hyatt (2001), benchmarking is the process of identifying the most sophisticated

practices of other organizations and the borrowing of knowledge to create competitive advantages. Yasin (2002) defines benchmarking as a technique that can be used to identify strategic gaps and find the best strategies that eliminate such gaps. The work by Marković et. al. (2011) provides more details on benchmarking objects, which is a continuous process of identifying, understanding and adapting products, services, technologies and processes of the most successful companies in order to improve one's own business. From the point of view of management, the essence of benchmarking is described by Jetmarová (2011) who notes that it is an instrument for achieving goals through the study of the best practices and understanding of the process through which they were realized. Askarany (2014) considers benchmarking to be a practice and process at the same time, the implementation and dissemination of which is influenced by the characteristics of innovation. According to Bublyk (2009), the main essence and purpose of benchmarking is identification of differences from the compared reference bank (benchmark), determination of the causes of these differences and identification of opportunities for improving the objects of benchmarking. Moriarty and Smallman (2009) explore the theory of benchmarking, thoroughly analyzing the definition of benchmarking from different positions with the focus on its purposefulness.

Definition of benchmarking is focused on the following key areas: measurement through comparison, identification of the best practices, implementation, continuous improvement and systematic benchmarking (Camp, 1989; Hyatt, 2001; Anand & Kodali, 2008; Moriarty & Smallman, 2009; Al-Tarawneh, 2014; Alosani et al., 2016).

Benchmarking is considered as a direction of development of the strategic management concept (Yasin, 2002), competitiveness (Bublyk, 2009), a program for enhancing key business performance indicators (Moriarty & Smallman, 2009), an instrument of management of business processes (Kryvoruchko & Sukach, 2012), a mechanism for improving organizational efficiency (Alosani et. al., 2016), a method for comparing the effectiveness of management of small and medium-sized enterprises (Ladzani, 2016), a method for assess-

ing and comparing the situation on the venture capital market (Rajchlová & Svatošová, 2016).

Analytical review and generalization of scientific literary sources (Camp, 1989; Hyatt, 2001; Yasin, 2002; Anand & Kodali, 2008; Moriarty & Smallman, 2009; Bublyk, 2009; Marković et al., 2011; Jetmarová, 2011; Kryvoruchko & Sukach, 2012; Al-Tarawneh, 2014; Alosani et al., 2016; Ladzani, 2016) revealed the existence of theoretical positions and practical experience in applying benchmarking to various economic agents. At the same time, the main attention is paid to the classification and characterization of certain types of benchmarking, the technique of its realization, the principles of organization and the use of its results in practice.

However, the issue of use of benchmarking in banks has not been widely developed and concerns mainly the formation of the quality and competitiveness of banking services (Soteriou & Zenios, 1999), justification for the need to improve business processes (Kloba, 2009), analysis of efficiency and effectiveness (Memić, 2013; Chandrasekaran & Madhana Gopal, 2013), the study of the most influential factors of net interest margin in different regions (Boutin-Dufresne et al., 2013), ensuring the financial security of banks (Tysyachna et al., 2015). At the same time, there is practically no methodical basis for conducting banking benchmarking; insufficiently investigated remain the issues of using benchmarking as a technology of financial management of banks, which makes it possible to increase the efficiency of implementation of such functions as planning, analysis and control. Also, insufficiently defined is the procedure for identifying a reference bank for comparison, which is important from the point of view of adapting its experience by the recipient bank due to the possible fundamental differences in their functioning.

As regards the stages of benchmarking, it is necessary to note different levels of their specification. Camp (1989) distinguishes: the planning stage (identification of the subject of benchmarking, identification of comparable organizations, determination of the method of data collection and their direct collection); the stage of analysis (definition of "gaps" in performance, prediction of

the future performance levels); the stage of integration (discussing the results of benchmarking, setting functional goals); the stage of action (development of the plan of action, implementation of measures and monitoring of results, review of the objects of comparison); the stage of maturity (achievement of leadership positions and full integration of the best practices). Jetmarová (2011) presents a slightly different sequence of benchmarking: the planning phase (determination of the subject of benchmarking, depth of research, goal setting); the phase of data collection (the collection of internal and external data, the search of a partner for benchmarking, establishing contact for further cooperation, obtaining detailed data from the benchmarking partner, obtaining the data on the benchmarking partner from other sources); the analysis phase (transformation of data into information, sorting, monitoring of information, exclusion of irregular information, identification of differences between the organization's functioning and the best practices, classification of the causes of differences, identification of processes that require improvement, formulation of new goals, definition of the plan of changes); the phase of adaptation (development of a plan, implementation of the best practices, the connection of the new plan with the current one). In aggregated form, the benchmarking procedure is provided by Marković et al. (2011), which consists of the preparatory phase (deciding what will be measured and based on what criteria); the phase of benchmarking (data collection, measurement of results, evaluation of gaps); post-benchmarking phase (obtaining results, developing a plan of action, developing a strategy), the phase of the process of reproduction (feedback as the basis for future decisions). Kryvoruchko and Sukach (2012) offer the following sequence of benchmarking: the choice of the subject of benchmarking, internal research, the choice of reference organization, collection of external information, analysis and identification of opportunities for improvement, introduction of new ideas and proposals.

Generalization of the existing approaches made it possible to form a general list of stages of implementation of banking benchmarking: the selection of processes and objects for comparison; substantiation of the composition of indicators for evaluation; selection of the reference bank; calcu-

lation and analysis of indicators of the recipient bank and the reference bank; determining the recommended values of indicators for the recipient bank; determining the directions for improving the functioning of the recipient bank and adapting the best results to the conditions of the bank's operations.

1.2. Life cycle concept

The concept of a life cycle, which appeared in the middle of the XX century, combines the idea of heredity, development, adaptation, survival at the level of individuals, organisms and their populations. Subsequently, analogies with living organisms began to be used in economics to study the processes of life of economic entities. According to the concept of a life cycle, the development of an economic entity can be described from the point of view of the stages of its life cycle, which are associated with causal relationships with the portfolio of strategies, structures, problems that it faces during its functioning. At each stage of a lifecycle, an economic entity has a certain configuration of characteristics that are similar at one and the same stage of the life cycle and different at others. Rahimi and Fallah (2015) indicate the influence of the life cycle on the company's parameters, stressing that ignoring the organizational scheme of life cycle by managers is one of the problems that hinder the implementation of the relevant strategy.

Today, the theory of a lifecycle continues to be within the scientific interests of researchers, expanding the scope of its application. A thorough theoretical generalization and systematization of the company's life cycle models is presented in the work of Ionescu and Negrusa (2007) who distinguish resource models, crisis models, models of inertia and decline, and also indicate that management emphasizes different goals during different phases of the companies' life cycle: in the beginning of their functioning, they are oriented towards production, during the second stage, marketing goals prevail, and during the third stage – financial goals. From this, it follows that, since benchmarking is aimed at identifying and borrowing the best practices, they must be different for each stage of the life cycle, since the goals of functioning of economic entities differ.

Auzair (2010) also considers the theory of life cycle from the point of view of management and notes that the system of management needs changes in the process of going through the stages of life cycle to ensure that the system meets a variety of its needs. Gao and Alas (2010) demonstrate the relation between the stages of life cycle and the types of crises that may arise in the activity of enterprises that have significant potential for the use in crisis management. In the context of risk and uncertainty, Kuzmin (2017) explores the use of the concept of life cycle emphasizing its importance for solving the tasks of management. Gurianova et al. (2014) analyze the stages of the organization's life cycle through the lens of transaction costs; Jaafar and Halim (2016) indicate that the theory of life cycle is considered from the point of view of changing the value of the company, while Nordström et al. (2012) study organizational efficiency and its dependence on a certain stage of the life cycle.

The abovementioned gives grounds for concluding that the stages of life cycle affect the goals, strategies, financial and non-financial parameters, the effectiveness of economic agents, and, therefore, should be taken into account when choosing a reference organization in the process of benchmarking.

1.3. DEA approach

The basis of DEA is a method of linear programming, which makes it possible to find the optimal solution among the set of permissible ones. Charnes, Cooper, and Rhodes (1978), who were the first to use this method in practice and gave it the name DEA, note that the solution of the problem is reduced to the construction of an "efficient frontier" in the multidimensional environment of characteristic parameters of analyzed objects and determination of the relative efficiency of these objects.

The DEA method has become widespread in various areas of the economy to measure efficiency, productivity, performance at the level of both individual actors, regions and countries. Thus, Emrouznejad and Thanassoulis (2010) offered a dynamic index of productivity of 17 in-

dustrialized countries based on the DEA method; Khodabakhshi and Aryavash (2014) use it to measure the productivity of forest districts. Shewell and Migiro (2016) highlighted the advantages of the DEA method for assessing the effectiveness of business units and presented the results of a literature review regarding its use for assessing information technologies and the system of management of supply chains. This method is also used to determine the production efficiency of automobile transport in the regional context (Grigoriev, 2010), to evaluate the efficiency of crop production (Dolgikh, 2015). One should emphasize the popularity of the DEA method in banking practice for analyzing and evaluating the efficiency, productivity and effectiveness of bank branches (Porembski et al., 2005; Wu et al., 2006; McEachern & Paradi, 2007; Gaganis et al., 2009; Paradi et al., 2010), analyzing operational activities of banks (Lin et al., 2009), measurement of banking performance and its comparison in the private and public banking sector (Miencha et al., 2015), measurement of the cost, revenue and profit efficiency (Kocisova, 2014).

According to the DEA method it is possible to calculate the efficiency in two ways: output orientation (maximization of output variables) or input orientation (minimization of input variables). We carried out generalization of DEA models and found out that most of them use an input focused model (Camanho, 2008; Gaganis et al., 2009; Lin et al., 2009; McEachern & Paradi, 2007; Paradi et al., 2010; Porembski et al., 2005; Sherman, 2006; Wu et al., 2006) This model will be used when selecting a reference bank for benchmarking comparison.

2. RESEARCH METHODOLOGY

This study is based on using the DEA method to determine the most efficient bank as a reference bank in benchmarking comparison; canonical analysis – for the formation of a list of indicators of bank performance; cluster analysis – to substantiate the levels of deviations of the actual values of comparable indicators from the target ones.

The proposed technology of banking benchmarking consists of the following stages (Fig. 1):

Stage 1 – selection of processes and objects for comparison. Such object is the effectiveness of management of finances, customer base, business processes and personnel of the bank.

Stage 2 – substantiation of the composition of indicators for evaluation. Taking into account the views of Wu, (2012), Ombuna et al. (2013), Ozturk & Coskun (2014), such indicators are the indicators of the Balanced Scorecard Subsystems (BSC) "Finance", "Customers", "Business Processes", "Personnel development". Since the number of indicators is quite significant, which complicates benchmarking comparison and further development of financial decisions, the BSC subsystems distinguish the indicators with the strongest interconnections according to the approach proposed by Chmutova et al. (2017).

Stage 3 – the choice of the reference bank. In order to compare the values of indicators according to the BSC subsystems, it is necessary to choose a bank that operates effectively on the banking market. The choice of the reference bank is proposed to be carried out in a two-level procedure:

- at the first level, the list of potential objects for comparison contains only those banks that at the current moment are at the same stage of their life cycle as recipient banks. The life cycle stage is determined on the basis of the empirical model built by Vasylieva and Chmutova (2015);

- at the second level, the rating of the selected banks is carried out according to the value of the efficiency indicator (θ) calculated by the DEA method.

Regarding the type of the DEA model (CCR or BCC), Chmutova and Afanasenko (2011) justified the feasibility of using the CCR model in the ranking of banks, which looks as follows:

$$\min_{\theta, \lambda} \theta, \qquad (1)$$

with restrictions:
$$\begin{cases} \theta x_0 - X\lambda \geq 0, \\ Y\lambda \geq y_0 \\ \lambda \geq 0, \end{cases}$$

where θ – efficiency indicator; X – vector of input variables; Y – vector of output variables; λ – vector of constants, which are weight values; x_i – vector of input variables of the i-th object; y_i – vector of output variables of the i-th object.

Efficiency is high if θ is 1 and low if $\theta < 1$.

During the next step, it is necessary to select input and output parameters of the model. Taking into account the existence of two main approaches to the selection of parameters – the intermediary and production ones, as well as the scope of these approaches (the first is used mainly for the comprehensive assessment of banks, and the second – for the assessment of their branches and departments), for this study we have chosen the intermediary approach. It considers banks as financial intermediaries, which accumulate the borrowed funds of customers and lend them to others at a profit. All accumulated funds and associated costs serve as input variables, while the funds provided to customers are output variables (see Figure 1).

Stage 4 – calculation and analysis of indicators with the closest connections between BSC subsystems "Finance", "Customers", "Business processes", "Development of personnel" of the reference bank and the recipient bank.

Stage 5 – setting the levels of recommended values for the recipient bank. Given the high level of comparability of the recipient bank and the reference bank (due to the selection of the latter from the list of banks at the same stage of life cycle as the recipient bank), the values of indicators achieved by the reference bank are to be used by the investigated bank as reference points in the planning of activities.

Stage 6 – determining the directions for improving the functioning of the recipient bank taking into account the chosen development strategy, goals and available resources, as well as the adaptation of the best results found to the conditions of the bank's activities. The implementation of this phase involves identification of deviations in the values of the comparable indicators, determination of the causes of such deviations and development of proposals for their elimination. It is important to determine the significance of deviations of the
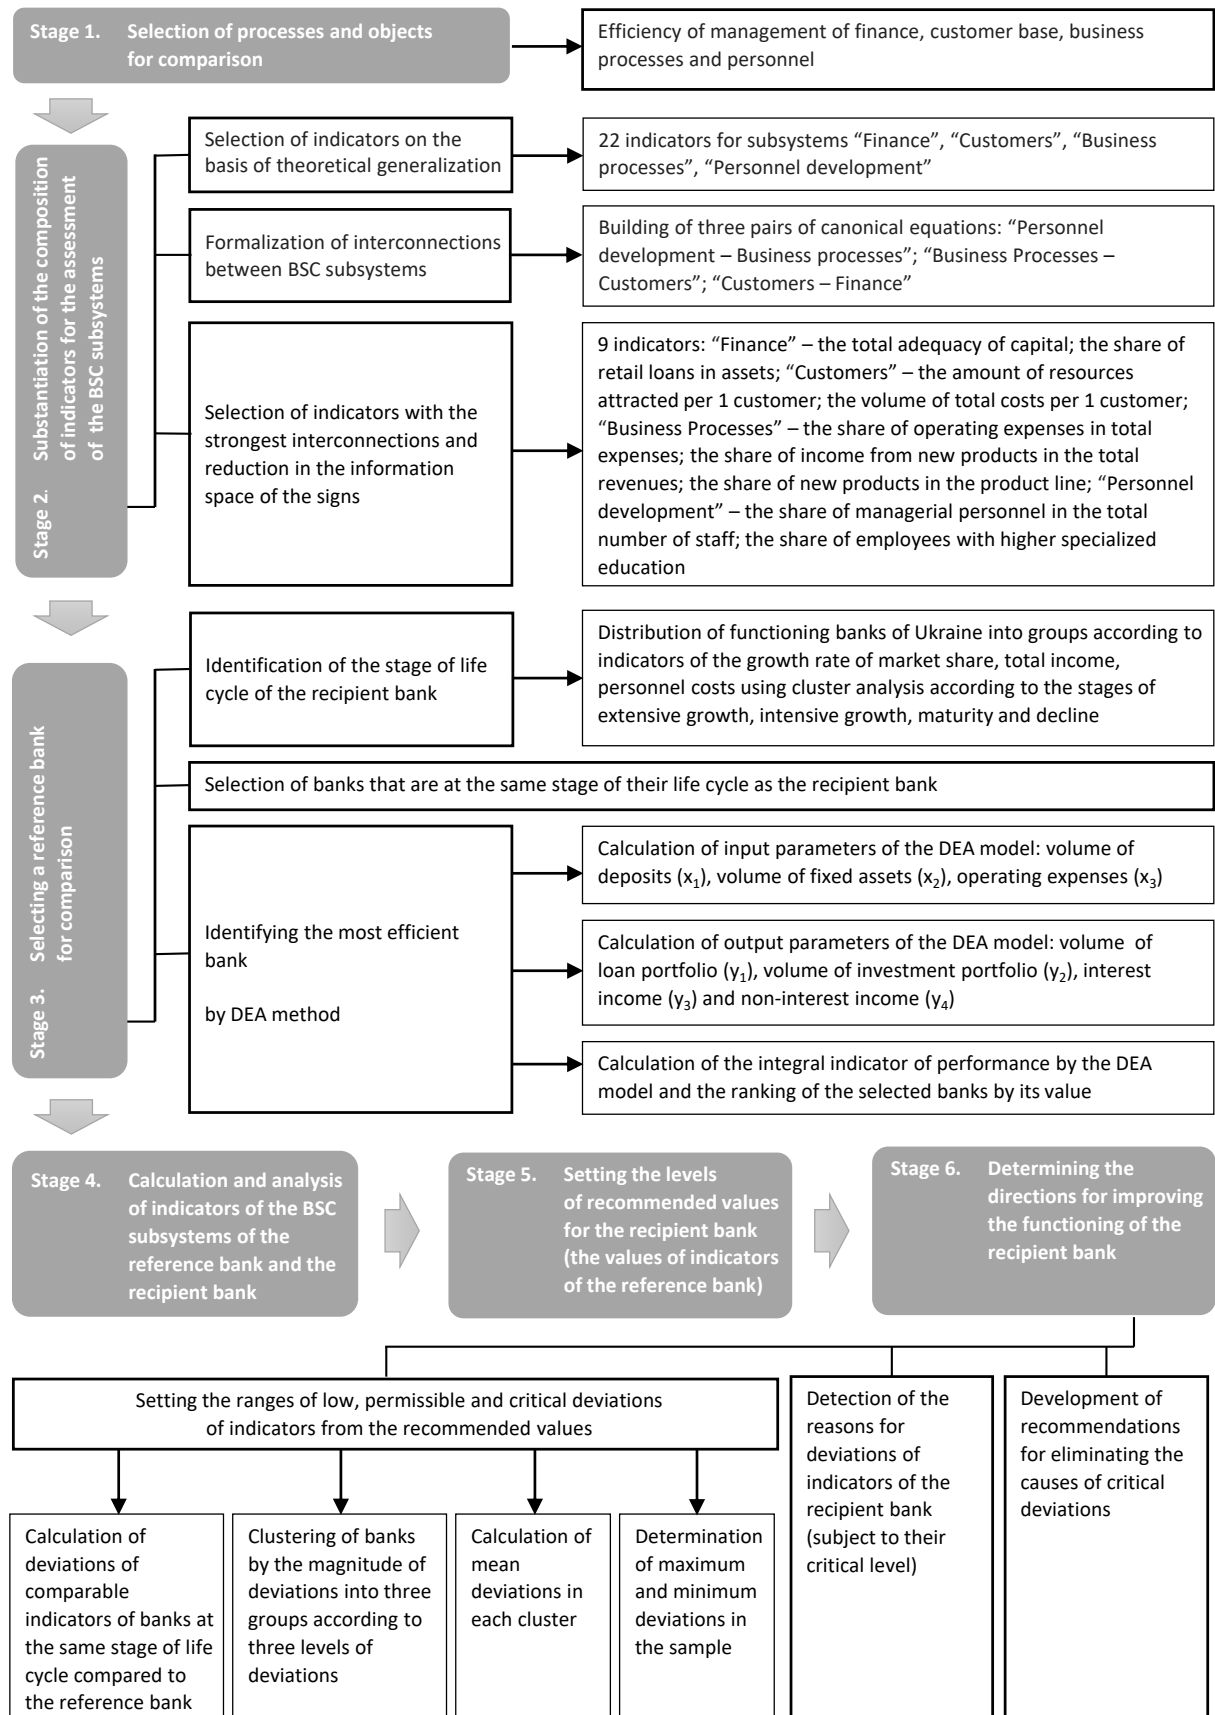

Stage 1. Selection of processes and objects for comparison

→ Efficiency of management of finance, customer base, business processes and personnel

Stage 2. Substantiation of the composition of indicators for the assessment of the BSC subsystems

Selection of indicators on the basis of theoretical generalization

→ 22 indicators for subsystems "Finance", "Customers", "Business processes", "Personnel development"

Formalization of interconnections between BSC subsystems

→ Building of three pairs of canonical equations: "Personnel development – Business processes"; "Business Processes – Customers"; "Customers – Finance"

Selection of indicators with the strongest interconnections and reduction in the information space of the signs

→ 9 indicators: "Finance" – the total adequacy of capital; the share of retail loans in assets; "Customers" – the amount of resources attracted per 1 customer; the volume of total costs per 1 customer; "Business Processes" – the share of operating expenses in total expenses; the share of income from new products in the total revenues; the share of new products in the product line; "Personnel development" – the share of managerial personnel in the total number of staff; the share of employees with higher specialized education

Stage 3. Selecting a reference bank for comparison

Identification of the stage of life cycle of the recipient bank

→ Distribution of functioning banks of Ukraine into groups according to indicators of the growth rate of market share, total income, personnel costs using cluster analysis according to the stages of extensive growth, intensive growth, maturity and decline

Selection of banks that are at the same stage of their life cycle as the recipient bank

Identifying the most efficient bank by DEA method

→ Calculation of input parameters of the DEA model: volume of deposits (x_1), volume of fixed assets (x_2), operating expenses (x_3)

→ Calculation of output parameters of the DEA model: volume of loan portfolio (y_1), volume of investment portfolio (y_2), interest income (y_3) and non-interest income (y_4)

→ Calculation of the integral indicator of performance by the DEA model and the ranking of the selected banks by its value

Stage 4. Calculation and analysis of indicators of the BSC subsystems of the reference bank and the recipient bank

Stage 5. Setting the levels of recommended values for the recipient bank (the values of indicators of the reference bank)

Stage 6. Determining the directions for improving the functioning of the recipient bank

Setting the ranges of low, permissible and critical deviations of indicators from the recommended values

Calculation of deviations of comparable indicators of banks at the same stage of life cycle compared to the reference bank

Clustering of banks by the magnitude of deviations into three groups according to three levels of deviations

Calculation of mean deviations in each cluster

Determination of maximum and minimum deviations in the sample

Detection of the reasons for deviations of indicators of the recipient bank (subject to their critical level)

Development of recommendations for eliminating the causes of critical deviations

Figure 1. The sequence and content of the stages of benchmarking relating to the performance of banks

actual values of indicators from the planned ones as the directions of response are planned depending on their values. If the value of deviations does not reach critical levels, active measures should not be used; in the opposite case, one carries out the search and implementation of reserves for ensuring the planned values of parameters and normalization of the analyzed areas of activity. Based on this, it is necessary to set the limits of low, permissible and critical deviations of indicators that reflect the effectiveness of management of finances, customer base, business processes and bank personnel. To do this the following procedure is offered:

1) identification of deviations of the values of comparable indicators of banks at one and the same stage of their life cycle from the reference bank selected at stage 3;

2) clusterization of banks based on the magnitude of deviations through the method of k-means (since it is necessary to obtain three clusters according to three levels of deviations, that is, the number of clusters is known in advance);

3) calculation of the average values of deviations in each cluster;

4) setting the ranges of low, permissible and critical deviations of indicators taking into account average values in the clusters, economic content of the indicators, their normative or recommended values in the banking practice, as well as maximum and minimum deviations in the sample.

Based on the established ranges of deviations of comparable indicators, the degree of achievement of the goals set by the recipient bank is determined, the causes of critical deviations are identified, recommendations for their elimination are offered.

3. EMPIRICAL RESULTS

The proposed technique of benchmarking is tested on the example of Ukrainian banks, whose stage in 2016 was identified as "intense growth" on the basis of the approach developed by Vasylieva and Chmutova (2015). The calculated values of the per-

formance indicator according to the DEA model and bank rankings for this indicator are presented in Table. 1. The calculations were carried out in the Microsoft Excel program in the "solution search" module.

Table 1. Performance indicators and the ranking of banks at the stage of intense growth

Bank	Performance indicator (θ)	Ranking
CREDITWESTBANK PJSC	1	1
PROMINVESTBANK PJSC	1	1
SBERBANK PJSC	1	1
FINANCIAL INITIATIVE CB PJSC	1	1
CREDIT AGRICOLE BANK PJSC	1	1
KREDOBANK PJSC	1	1
BANK VOSTOK PJSC	1	1
BM BANK JSC	1	1
CREDIT EUROPE BANK PJSC	1	1
INTERNATIONAL INVESTMENT BANK PJSC	1	1
TRUST-CAPITAL PJSC JSB	1	1
UKRAINIAN CONSTRUCTION INVESTMENT BANK JSC	1	1
CONCORD PJSC JSCB	1	1
CB CENTER PJSC	1	1
FORTUNA-BANK JSC	0.99	2
MOTOR BANK PJSC	0.94	3
BANK FOR INVESTMENT AND SAVINGS	0.87	4
BANK SICH PJSC	0.85	5
RADABANK PJSC JSCB	0.85	5
UKRSOTSBANK PJSC	0.84	6
COMINVESTBANK PJSC	0.84	6
OKCI BANK PJSC	0.84	6
FINBANK PJSC	0.75	7
PROCREDIT BANK JSC	0.72	8
DIAMANTBANK PJSC	0.71	9
ARKADA PJSC JSCB	0.71	9
BANK GRANT PJSC	0.49	10

In the study, BANK GRANT PJSC was chosen as a recipient bank, because the level of its performance is insufficient (the efficiency indicator is less than one and equals 0,49). CREDITWESTBANK PJSC is the reference bank because it has a high efficiency level (equals 1) and according to its activities is comparable with the recipient bank.

The compared indicators for the BSC subsystems "Finance", "Customers", "Business processes", "Personnel development" of the reference bank and the recipient bank, as well as their deviations, are

Table 2. Comparable indicators of the reference bank and the recipient bank

BSC indicators	Values of indicators		Deviations of indicators of the recipient bank from the values of the reference bank
	CREDITWESTBANK PJSC (reference bank)	BANK GRANT PJSC (recipient bank)	
Subsystem "Finance"			
General adequacy of capital	37.600	21.200	−16.400
The share of retail loans in assets, %	0.1	8.4	8.3
Subsystem "Customers"			
The volume of general expenses per 1 customer, thousand UAH	4.910	7.502	2.592
The volume of attracted resources per 1 per 1 customer, thousand UAH	47.390	42.409	-4.981
Subsystem "Business processes"			
The share of operating expenses in total costs, %	88.396	81.590	−6.806
The share of new products in the product line, %	26.550	16.670	−9.880
The share of income from new products in total revenue, %	31.190	5.100	−26.090
Subsystem "Personnel development"			
The share of managerial staff in the total number of personnel, %	0.400	0.230	−0.170
The share of employees with higher specialized education in the total number of personnel, %	90.460	70.910	−19.550

given in Table. 2. In order to establish whether certain deviations are critical for the recipient bank and, therefore, to specify the measures to improve its efficiency, we have calculated the ranges of deviations of comparable indicators of 27 Ukrainian banks (which were at the stage of intensive growth) from the reference values.

The procedure is carried out according to the sixth stage of the benchmarking technology described above. The cluster analysis is conducted in the package Statistica 8.0 for each of the nine comparable indicators with prior standardization of their values. The quality of clusterization and the mean values of deviations in each cluster are illustrated by the data in Table. 3

Based on the calculation of mean values in the clusters, taking into account maximum and minimum deviations in the sample, economic content of the indicators, we have established the

ranges of deviations of the compared indicators and their levels for the recipient bank BANK GRANT PJSC (Table 4).

In general, deviations of the comparable indicators of BANK GRANT PJSC are characterized by low and acceptable levels, which do not require immediate changes in the bank's activities. The indicator of the share of new products in total revenues has a critical deviation. Therefore, it is necessary to analyze the period of introduction of new products or services on the market, as they may not immediately bring the desired levels of income. It is also necessary to provide analytical support for the implementation of financial innovations by calculating their expected efficiency and to control the profitability of new banking products through the matching of incomes and expenses and identifying those types that are not profitable in the current and prospective periods, as well as determining the reasons for profit losses.

Table 3. Characteristics of clusterization and mean values of deviations of comparable indicators from the reference values (for banks at the stage of intensive growth)

Indicator	Intergroup variance (between SS)	The degree of freedom (df)	Inter-group variance (within SS)	The degree of freedom (df)	F- criterion	p- level of significance of the F- criterion (signif. p)	Average deviation in the cluster		
							Cluster 1	Cluster 2	Cluster 3
General adequacy of capital	222.5121	2	35.63642	36	112.3911	0.000000	–20.734	–19.180	18.830
The share of retail loans in assets	34.04647	2	3.953533	36	155.0098	0.000000	51.145	27.641	3.555
The volume of general expenses per 1 customer	33.06992	2	4.930084	36	120.7400	0.000000	9.693	1.020	–0.913
The volume of attracted resources per 1 per 1 customer	31.21059	2	6.789408	36	82.74516	0.000000	–29.970	–19.763	–42.890
The share of operating expenses in total costs	34.38114	2	3.618862	36	171.0097	0.000000	–20.027	–5.322	6.040
The share of new products in the product line	32.42335	2	5.576653	36	104.6542	0.000000	–2.141	–10.317	–15.778

Table 4. Ranges of deviations of comparable indicators and their levels for BANK GRANT PJSC

Indicators	Ranges of deviation			Deviations of BANK GRANT PJSC	
	Low level	Acceptable level	Critical level	Value	Level
Subsystem "Finance"					
General adequacy of capital	[0; –19.18]	(–19.18; –27.00]	(–27.00; –29.77]	–16.400	Low
The share of retail loans in assets, %	[0; 27.64]	(27.64; 51.15]	(51.15; 62.09]	8.3	Low
Subsystem "Customers"					
The volume of general expenses per 1 customer, thousand UAH	[0; 1.02]	(1.02; 9.69]	(9.69; 11.83]	2.592	Acceptable
The volume of attracted resources per 1 per 1 customer, thousand UAH	[–4.98; –19.76]	(–19.76; –29.97]	(–29.97; –46.56]	–4.981	Low
Subsystem "Business processes"					
The share of operating expenses in total costs, %	[0; –5.32]	(–5.32; –20.03]	(–20.03; –26.02]	–6.806	Acceptable
The share of new products in the product line, %	[0; –10.32]	(–10.32; –15.78]	(–15.78; –19.14]	–9.880	Low
The share of income from new products in total revenue, %	[0; –7.67]	(–7.67; –16.97]	(–16.97; –30.44]	–26.090	Critical
Subsystem "Personnel development"					
The share of managerial staff in the total number of personnel, %	[0; –0.15]	(–0.15; –0.22]	(–0.22; –0.27]	–0.170	Acceptable
The share of employees with higher specialized education in the total number of personnel, %	[0; –17.71]	(–17.71; –29.97]	(–29.97; –39.94]	–19.550	Acceptable

CONCLUSION

Benchmarking is an effective technique for managing the bank's finances, which makes it possible to identify the strengths and weaknesses of its functioning, to constantly monitor and implement the best practices, to use the revealed patterns in the implementation of the functions of financial management.

The assessment of bank performance is based on the BSC method while the selection of indicators for benchmarking comparisons is based on the identification of causal relationships between the subsystems "Finance", "Customers", "Business processes", "Personnel development" that emerge on each stage of the bank's life cycle reflecting its target characteristics. It makes it possible to determine the directions and order of realization of the bank's objectives and to form mechanisms for their achievement.

The developed procedure for bank benchmarking involves a two-stage process of selecting a benchmark reference bank for comparison: 1) selection of banks that at the current moment are at the same stage of their life cycle as the recipient bank; 2) ranking of the selected banks according to the value of indicator of integral efficiency calculated with the DEA method and identification of the most efficient bank.

The technique of benchmarking is also supplemented by the determination of the boundaries of low, permissible and critical deviations of the actual values of comparable indicators of the management of finances, customer base, business processes and bank personnel from the recommended ones. This is implemented in the following sequence: 1) identification of deviations of the values of comparable indicators of banks at one and the same stage of their life cycle from the reference bank; 2) clusterization of banks based on the magnitude of deviations according to three levels of deviations (low, permissible and critical); 3) calculation of average deviations in each cluster; 4) setting the ranges of deviations taking into account average values in the clusters, economic content of the indicators, their normative or recommended values in the banking practice, as well as maximum and minimum deviations in the sample.
