## Dear friends and colleagues!

It doesn't matter how would human society lauded the importance of intelligence and social organization, the original basis of human being – is biological life. The biological evolution of man predetermined the formation of his intellectual function and social organization, as well as largely determines their current and future development. Moreover, the human as a species can not exist in isolation from the general system of wildlife. This is connected with the fact that most of the resources that support livelihoods and meet the basic needs of the people, also has a biological origin. The interdependence of humans and other species of biological life on Earth is so close and multifaceted, that if even one of the least significant element is falling out of the system, it reduces the overall viability of the entire biosphere. That is why, understanding the natural environment and its embeddedness in the structure of biological processes, a human has to take care of preservation, augmentation and development of all species. In this regard, the importance of zoology and botany, veterinary, agricultural and other biological sciences, in the context of the prospects for the survival of humanity, no less than, for example, medicine and pharmacology.
