

# PHOTOMETRIC RESEARCHES IN THE SELECTED KAPTEIN AREAS

M. P. Yasinskaya, L. Ph. Tomak, L. A. Zavershneva, A. V. Dragunova

Astronomical Observatory, Odessa National University  
T. G. Shevchenko Park, Odessa 65014 Ukraine, *astro@paco.odessa.ua*

**ABSTRACT.** B and V magnitudes of 4437 stars from Kapteyn Areas No 64, 65, 86, 87, 88, 98 are obtained. The catalogue and the star maps are given.

**Key words:** Stars: catalogue, B-, V-magnitudes, Kapteyn Areas: individual: 64, 65, 86, 87, 88, 98.

The classical method of colour indices of stars is applied to study of distribution of interstellar absorbing substance in a Galaxy. This method enables to determine simply and reliably the size of complete interstellar absorption on all distance up to a star using the photometry data in two photometric systems (in our case it is systems B and V). Initial materials for researches on this method are the catalogues of star magnitudes and parameters of colour of stars.

In 1906 J. Kapteyn has offered the plan in regular intervals allocated on the sky «of the Selected Areas» for study of a structure of a Galaxy. This plan provided study of all accessible physical characteristics of stars in 252 small areas, from which 206 are in regular intervals allocated on all sky, and 46 - in addition in a strip of the Milky Way.

At Odessa Astronomical Observatory since 1967 in co-operation with Abastumany Astrophysical Observatory (AAO) the work on study of distribution of interstellar absorbing substance in a direction selected Kapteyn Areas is carrying out. For this purpose the catalogues B and V magnitudes of stars for researched Kapteyn Areas are created. The researched Areas KA-64, KA-65, KA-86, KA-87, KA-88, KA-98 are interesting to that are located near to an equatorial plane of a Galaxy, where basic weight of absorbing substance contains.

## Equipment, observant material

The photographic material for researched Kapteyn Areas was obtained by M.S.Kazanasmas, L.A.Zavershneva and L.Ph.Tomak on unaberrational Schmidt camera of AAO in 1981 - 1988.

Optical parameters of unaberrational Schmidt camera are the following: the diameter of a spherical mirror 444 mm, diameter of a correctional lens 360 mm, focal length of a spherical mirror 625 mm, hence, scale on a photoplate is equal 5', 5 arches on millimetre, and light-grasp of the tool is 1:1,74.

It is possible to consider the Schmidt chamber, despite of presence in it of a lens, almost free from chromatic aberration. It also hasn't spherical aberration, astigmatism and coma [1]. The detailed description of a telescope is given in works [1] and [2].

For reception of a photometric material in system B, V of Johnson-Morgan were used filter Schott GG11 in a combination with a film A - 600 (V- magnitudes) and filter Schott GG13 in a combination with a film A- 500 (B-magnitudes).

## Technique of reception of stellar magnitudes

The photometric processing of the received photographic material was carried out on micro-photometer "МФ-2" with specially built - in round diaphragm. For all stars the measurements were carried out on three films.

The mistake of a field of the Schmidt camera was not taken into account, since on distance 2°20" from the centre of a photosnapshot, where was carried out photometry of stars, it does not exceed 0.01 stellar magnitude.

For areas Ka-86 and Ka-87 as standard the stars of a cluster NGC 6633, for a area KA-88 - star of a cluster NGC6940, for a area KA-98 - star of a cluster NGC 2264 and for KA-64, 65 a clusters NGC 6940, 6871 were used. The data for them were taken from the catalogue [5].

The standard technique was applied to reception of stellar magnitudes.

As numerous researches have shown, at use of films A - 500 and A - 600 in a combination with filters Schott GG13 and GG11 on the Schmidt' camera of AAO the standard photometric system BV is realized practically [3-6].

Table 1. The basic characteristics of areas

The name of a Areas	$\alpha$	$\delta$	b	l	N	$V_{\max}$	$V_{\min}$
KA-64	20 <sup>h</sup> 02 <sup>m</sup>	30°16'	68°	0°	478	6 <sup>m</sup> .63	12 <sup>m</sup> .34
KA-65	21 <sup>h</sup> 03 <sup>m</sup>	30°33'	71°	-12°	653	7 <sup>m</sup> .19	13 <sup>m</sup> .45
KA-86	18 <sup>h</sup> 15 <sup>m</sup>	15°00'	43°	14°	731	7 <sup>m</sup> .48	13 <sup>m</sup> .37
KA-87	19 <sup>h</sup> 15 <sup>m</sup>	15°11'	49°	1°	757	6 <sup>m</sup> .36	13 <sup>m</sup> .74
KA-88	20 <sup>h</sup> 14 <sup>m</sup>	15°26'	56°.5	-11°	970	7 <sup>m</sup> .25	13 <sup>m</sup> .75
KA-98	6 <sup>h</sup> 52 <sup>m</sup>	-0°15'	213°	1°	848	7 <sup>m</sup> .68	13 <sup>m</sup> .99

### Results of photometry of stars in researched Kapteyn Areas

As a result of computer data processing photometry of stars for researched Kapteyn Areas the catalogues of star magnitudes V and parameters of colour B-V were created. The random errors of the definition B- and V- magnitudes are less than  $\pm 0^m.04$ .

The information on researched Kapteyn Areas and about the catalogues, received for them, is given in the Table 1. The names of Kapteyn Areas are specified in the first column, in second - the equatorial coordinates of their centres (epoch 2000.0) are given, in the third column the galactic coordinates of the centres of platforms are given, the amount of stars included in the catalogue is specified in the fourth column, in the seventh and eighth columns the meanings of the maximal and minimal magnitudes of stars of the catalogues are given.

On Fig. 1 the scheme of division of the image of each areas into the fragments is given, and on Fig. 2 - Fig. 55 the images of cards of researched areas are given. The coordinate grid on cards corresponds to epoch 2000.0, designation of axes is standard.

The catalogues are given in the Tables 2 - 7. In first column the serial number of a star appropriate to its number on a card is given. In second column the star magnitude V, in third - parameter of colour B-V is given.
