# THE HISTOGRAM OF PULSARS' PERIODS DISTRIBUTION 

Vladimir P. Bezdenezhnyi<br>Department of Astronomy, Odessa National University<br>T.G.Shevchenko Park Odessa 270014 Ukraine<br>astro@paco.odessa.ua

#### Abstract

In considering of the distribution of periods for pulsars taken from Smith (1979) and GCVS (1976) data 20 peaks are found: at 0.672 sec , $0.450 \mathrm{sec}, 0.403 \mathrm{sec}, 0.270 \mathrm{sec}, 0.191 \mathrm{sec}$ and other smaller peaks. Identifications and comparison with the distribution of periods for $\delta$ Scuti stars are carried out.

Key words: Stars: pulsars, $\delta$ Scuti, RR Lyrae, Cepheids.
In Table 1 a histogram of pulsars' periods distribution ( $\mathrm{n}=105$ stars) based on the data taken from the book "Pulsars" by Smith (1979) is presented.

The intervals of periods $\Delta \mathrm{P}$ are taken as 0.05

Table 1: The histogram of pulsars' periods distribution ( $\mathrm{n}=105$ stars)

| $\Delta \mathrm{P}$ | $n_{\text {puls }}$ | $\Delta \mathrm{P}$ | $n_{\text {puls }}$ |
| :---: | :---: | :---: | :---: |
| $0.00-0.05$ | 1 | $1.20-1.25$ | 4 |
| $0.05-0.10$ | 1 | $1.25-1.30$ | 4 |
| 0.10 .15 | 0 | $1.30-1.35$ | 1 |
| $0.15-0.20$ | 6 | $1.35-1.40$ | 3 |
| $0.20-0.25$ | 4 | $1.40-1.45$ | 1 |
| $0.25-0.30$ | 4 | $1.45-1.50$ | 0 |
| $0.30-0.35$ | 3 | $1.50-1.55$ | 1 |
| $0.35-0.40$ | 7 | $1.55-1.60$ | 1 |
| $0.40-0.45$ | 6 | $1.60-1.65$ | 0 |
| $0.45-0.50$ | 6 | $1.65-1.70$ | 1 |
| $0.50-0.55$ | 5 | $1.70-1.75$ | 0 |
| $0.55-0.60$ | 5 | $1.75-1.80$ | 0 |
| $0.60-0.65$ | 2 | $1.80-1.85$ | 0 |
| $0.65-0.70$ | 8 | $1.85-1.90$ | 1 |
| $0.70-0.75$ | 6 | $1.90-1.95$ | 0 |
| $0.75-0.80$ | 3 | $1.95-2.00$ | 1 |
| $0.80-0.85$ | 4 | $2.00-2.05$ | 0 |
| $0.85-0.90$ | 1 | $2.05-2.10$ | 0 |
| $0.90-0.95$ | 1 | $2.10-2.15$ | 1 |
| $0.95-1.00$ | 0 | $2.15-2.20$ | 0 |
| $1.00-1.05$ | 2 | $2.20-2.25$ | 1 |
| $1.05-1.10$ | 2 | $2.25-2.30$ | 1 |
| $1.10-1.15$ | 0 | $2.30-2.35$ | 1 |
| $1.15-1.20$ | 1 | $3.70-3.75$ | 1 |

Figure 1: The distribution of pulsars' periods based on the data of the sampling according to Smith (1979).
sec. For control we give a histogram with intervals $\Delta \mathrm{P}=0.1$ sec (see Figure 1). In Table 2 and in Figure 2 the same histograms based on the data ( $\mathrm{n}=147$ stars) taken from "Third supplement to the third edition of the General Catalogue of Variable stars" (Kukarkin et al., abbreviation: GCVS, 1976) are given.

We used intervals $\Delta \mathrm{P}=0.02 \mathrm{sec}$ for control of our results too. On the base of our analyses of these histograms 20 peaks (maxima) at the following periods $P_{i}$ and frequencies $f_{i}$ corresponding to them are obtained (see Table 3). As it can be seen from figures and Table 3, the highest peaks are: $P_{11}=0.672$ $\mathrm{sec}, P_{8}=0.403 \mathrm{sec}, P_{9}=0.448 \mathrm{sec}, P_{6}=0.270 \mathrm{sec}$ and $P_{5}=0.191 \mathrm{sec}$. The ratios of the periods show that all periods are commensurable (often - multiple ones), as in the case of pulsating stars: $\delta$ Sct, bimodal Cepheids, RR Lyrae and other types. The histogram of pulsars' periods distribution is similar to one of $\delta$ Scuti stars

Figure 2: The distribution of pulsars' periods based on the data of the sampling according to GCVS (1976).
(Bezdenezhnyi, 1994b).
We can see five sequences of multiple periods. The first sequence is: $P_{7}=8 P_{2}=5 P_{3}=2 P_{5}=P_{12} / 2=$ $P_{18} / 5=P_{19} / 6=P_{20} / 10$. Eight periods are connected with multiple relation, and moreover the period $P_{7}$ is favoured one. We accept it for the main period and make up the ratios of every period $P_{i}$ to the period $P_{7}$. The second sequence is: $P_{6}=8 P_{1}=P_{10} / 2=P_{14} / 4$. And three more multiple relations are: $4 P_{8}=2 P_{13}=$ $P_{7}, P_{15}=8 P_{4}$ and $2 P_{11}=P_{16}$. Only period $P_{9}$ has no multiple ones in this table. Thus, we have five groups of periods, inside of wich multiple relations take place. The primary periods are: $P_{7}, P_{6}, P_{8}$ and $P_{11} / 2$ (because period $P_{11}$ lies between two double periods $P_{10}=2 P_{6}$ and $P_{12}=2 P_{7}$. We add two periods $P_{9}$ and $2 P_{4}$ to these primary ones as the period $P_{4}$ lies beside half period $P_{5}$. These six periods give us chance to make identifications as in the case of pulsating stars. We accept period $P_{7}$ as $P_{1 H}$ one - the first overtone of some fundamental period that is not seen in our histograms. The last column of Table 3 contains possible interpretations of these peaks.

From our list of periods we have probable identifications: $P_{6}=P_{s}, P_{8}=P_{e}, P_{9}=P_{r}$ and $P_{11} / 2=P_{g}$. These are periods introduced by the author earlier (Bezdenezhnyi, 1994a, 1994b, 1997) for RR Lyr -type and $\delta$ Sct stars. And period $2 P_{4}$ is identified as $P_{2 H}$ (the second overtone). At such identifications the theoretical ratios $k_{\text {theor }}=P_{i} / P_{1 H}$ are given in the fifth column of Table 3. The observed $P_{i} / P_{7}$ ratios are close

Table 2: The histogram of pulsars' periods distribution ( $\mathrm{n}=147$ stars)

| $\Delta \mathrm{P}$ | $n_{\text {puls }}$ | $\Delta \mathrm{P}$ | $n_{\text {puls }}$ |
| :---: | :---: | :---: | :---: |
| $0.00-0.05$ | 1 | $1.20-1.25$ | 6 |
| $0.05-0.10$ | 2 | $1.25-1.30$ | 4 |
| 0.100 .15 | 1 | $1.30-1.35$ | 4 |
| $0.15-0.20$ | 6 | $1.35-1.40$ | 3 |
| $0.20-0.25$ | 6 | $1.40-1.45$ | 3 |
| $0.25-0.30$ | 9 | $1.45-1.50$ | 1 |
| $0.30-0.35$ | 4 | $1.50-1.55$ | 1 |
| $0.35-0.40$ | 8 | $1.55-1.60$ | 2 |

| 6 | 0.270 | 3.704 | 0.715 | 0.711 | $P_{s}$ |
| 7 | 0.3775 | 2.649 | 1 | 1 | $P_{1 H}$ |
| 8 | 0.403 | 2.481 | 1.068 | 1.067 | $P_{e}$ |
| 9 | 0.448 | 2.232 | 1.187 | 1.185 | $P_{r}$ |
| 10 | 0.538 | 1.859 | 1.425 | 1.422 | $2 P_{s}$ |
| 11 | 0.672 | 1.488 | 1.780 | 1.778 | $2 P_{g}$ |
| 12 | 0.750 | 1.333 | 1.987 | 2 | $2 P_{1 H}$ |
| 13 | $0.801:$ | 1.248 | 2.122 | 2.133 | $2 P_{e}$ |
| 14 | 1.075 | 0.930 | 2.848 | 2.844 | $4 P_{s}$ |
| 15 | $1.210:$ | 0.826 | 3.205 | 3.200 | $4 P_{2 H}$ |
| 16 | $1.332:$ | 0.751 | 3.528 | 3.556 | $4 P_{g}$ |
| 17 | $1.616:$ | 0.619 | 4.281 | 4.264 | $4 P_{e}$ |
| 18 | 1.875 | 0.533 | 4.970 | 5 | $5 P_{1 H}$ |
| 19 | 2.270 | 0.441 | 6.010 | 6 | $6 P_{1 H}$ |
| 20 | $3.745:$ | 0.267 | 9.920 | 10 | $10 P_{1 H}$ |

to theoretical ones from multiplicity viewpoint. In 19 cases of 20 the observed period ratios are different from theoretical ones within 0.03 .

Thus, similarly to pulsating stars, the periods of pulsars are close to periods $P_{1 H}, P_{2 H}, P_{r}, P_{e}, P_{g}$, $P_{s}$ and multiple to them ones. It is curiously that fundamental period $P_{f}$ is absent in this range.
